Summary

The concept behind this technology is that company stock price profiles contain patterns that are indicative of future movements and directions. Ted Warren published a book in the 1960s about how to recognize and invest (and profit) based on certain easily recognizable geometric patterns (this approach falls under the heading of Technical Analysis). A type of artificial intelligence, called Artificial Neural Networks, takes this concept a quantum leap forward because it can recognize complex patterns that are not discernable to the human eye. Fundamentally the Neural Network is analyzing the history of the stock and then predicting where the price will end up over the next year (up or down).

Thus a Neural Network is “trained” to recognize patterns in company price and volume (and other data) profiles, and then to predict the high-end or low-end price of each stock over the next year. In this case Neural Networks were trained with inputs spanning a period of 1,200 trading days and outputs of the high/low price points over the next 300 trading days. Refer to pages 5, 6, & 7 for more details.

The performance of each Neural Network is forecast-tested by having it analyze the stock profiles of other companies which were not in its training data set (companies that it had never “seen” before). The Neural Network stock selection set needs to be able to beat the market average Return on Investment (ROI) – that is the net increase/decrease of all of the forecast test stocks over the investment period - in order for it to be considered “successful”.

Of a pool of 198 companies, 99 are used for training of the Neural Networks and the remaining 99 are used for forecast testing of these same Neural Networks. Prior to training and forecast testing, the training/test time window intervals of the companies and their data are shuffled in random order by the software such that they fall somewhere in a 10 year time span between 2005 and 2015.

Summary

These time intervals (set by the software) span 1,200 trading days and are for training input to the Neural Network. The 300 trading days following each of these 1,200 trading day intervals are used for the training output to the Neural Network. Again - these time intervals are randomly selected by the software and can lie anywhere in the 10 year time span interval between 2005 and 2015.

When performing forecast testing, a rule set is implemented which makes the buy/sell decision based on the value of the Neural Network output signal-strength for a particular stock. If the Neural Network predicted price point exceeds the rule set specified percentage of the purchase price, the stock is purchased. The stock is then held until the end of the investment time period (300 trading days) and sold.

The high-achieving Neural Networks (called Super Nets) were able to achieve remarkable ROIs as shown on pages 12 through 25.

Example Case #5 Training Set

In this example case, a pool of 198 companies was used for training and forecast testing purposes. The criteria was that there had to be at least 24 years worth of available financial data. Capitalization and market sector were not considerations in the selection criteria – on the contrary, the selected companies covered a broad range of capitalizations and market sectors from the NYSE and NASDAQ exchanges.

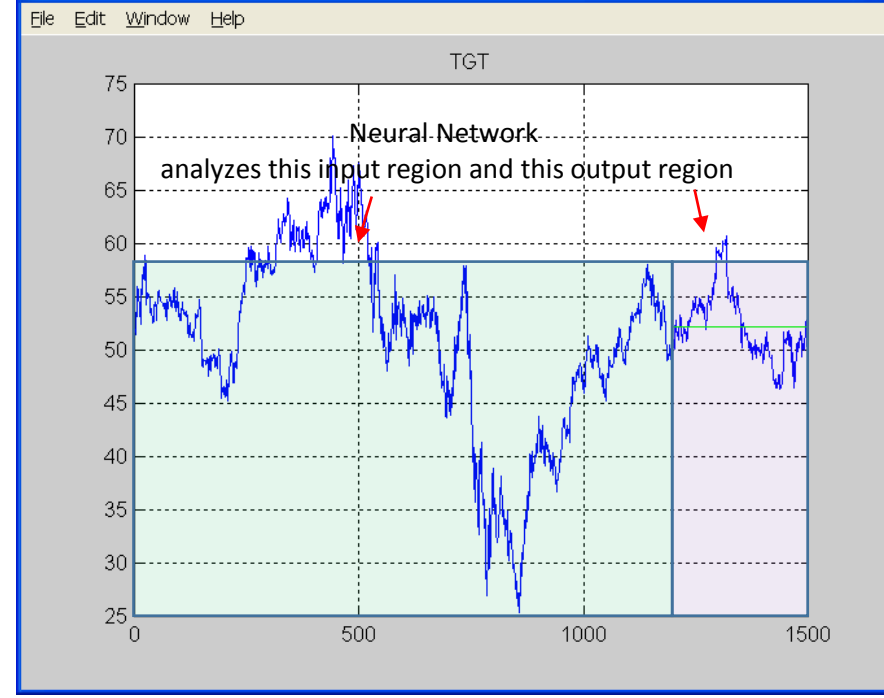

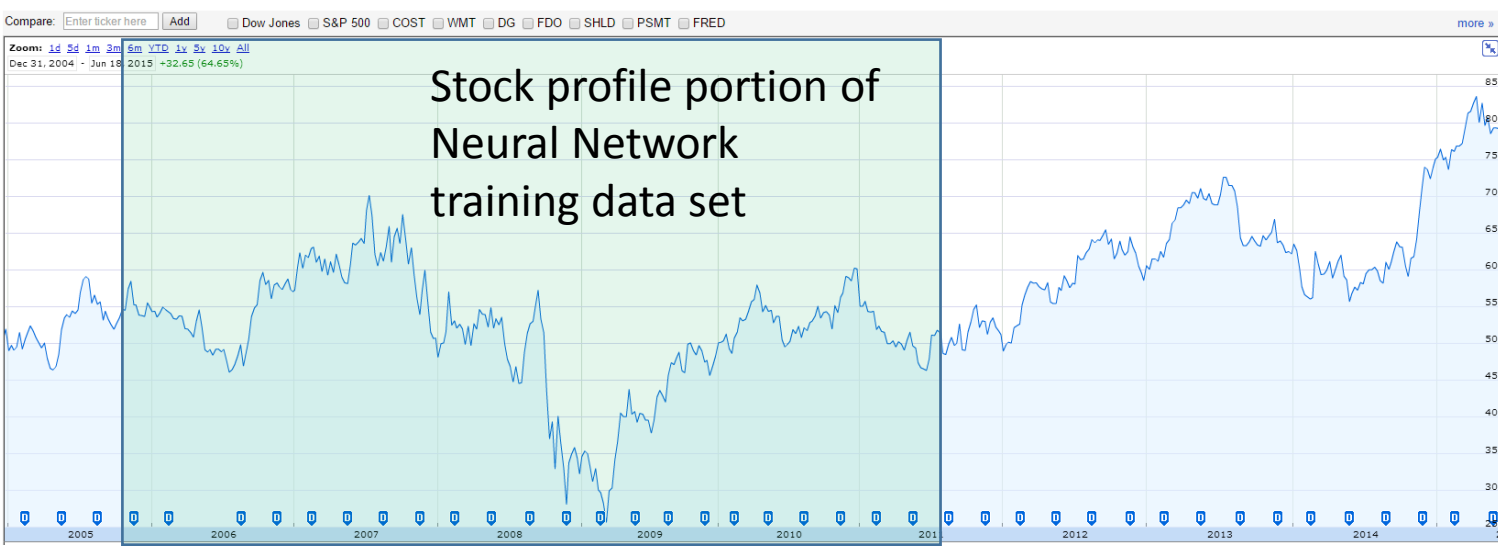

The training and forecast test sets were generated from time windows of 1,500 days for which the start date was randomly selected by the software, inside a 10 year time interval – 2005 to early 2015.

The following 99 companies were used for training,

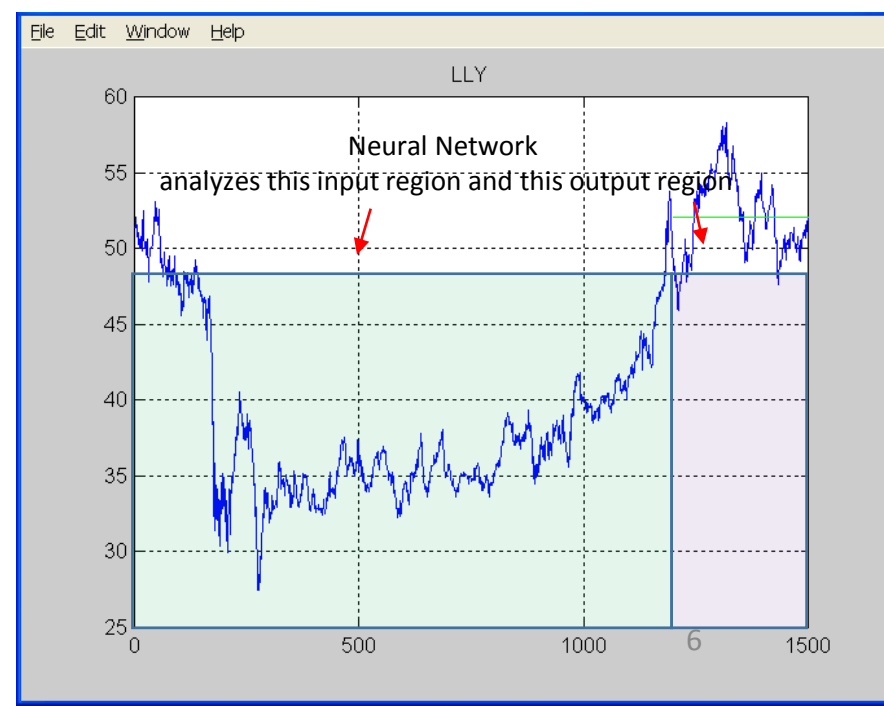

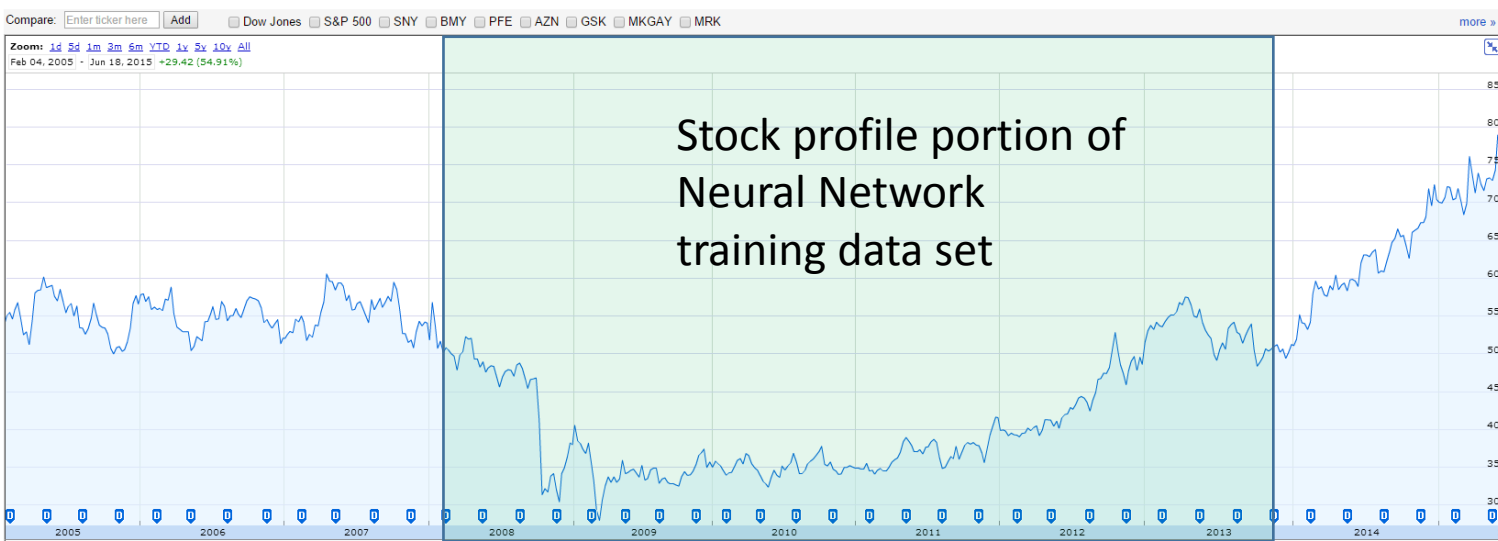

JBHT,	MLHR,	ANGO,	HPQ,	MATW,	MLM,	BKMU,
AFL,	DRI,	EA,	AEP,	PAYX,	KELYA,	CAG,
MMM,	AIR,	BEN,	GSK,	CAT,	PCG,	SHLM,
HD,	MENT,	JKHY,	ACIW,	ED,	AGU,	RBCAA,
RJET,	ADM,	PNK,	CVGI,	OXY,	MTZ,	HRL,
WWW,	BF-A,	WDC,	LLTC,	BAX,	HSY,	HMC,
SJW,	ATU,	AMIC,	GRMN,	CSU,	SYBT,	TROW,
BBY,	PPL,	BBOX,	ONB,	AXTI,	CSCO,	EMC,

UDR	100.0	24.1	32.4	134.5	34.5	2389.1
DOW	100.0	27.9	38.2	137.2	37.2	2526.3
SUBK	100.0	18.0	19.3	107.2	7.2	2633.5
ENL	100.0	24.6	33.8	137.6	37.6	2771.1
TXN	100.0	27.4	40.8	149.0	49.0	2920.1
PFE	100.0	19.0	25.2	132.6	32.6	3052.7
WBS	100.0	29.4	34.6	117.6	17.6	3170.3
IDTI	100.0	7.6	5.3	69.8	-30.2	3240.1
SJR	100.0	19.7	21.0	106.6	6.6	3346.7
CPB	100.0	33.3	32.2	96.9	-3.1	3443.6
VMC	100.0	59.9	84.2	140.5	40.5	3584.1
DE	100.0	85.5	89.0	104.1	4.1	3688.2
SPLS	100.0	15.1	17.8	118.4	18.4	3806.6
CASY	100.0	38.4	47.1	122.8	22.8	3929.5

The software “invests” (simulated, of course) an equal amount of money in each of the 99 forecast test companies and only sells the stock at the end of the investment period (300 trading days in this case). This produces a “market average” ROI – in this case the market average ROI for these stocks was **19.7%** (see next page).

Thus the Neural Network stock price predictors have to produce an ROI that beats this number in order to be considered “successful”.

Performance Results

The total market average ROI for this group of forecast test stocks was 19.7%

Monte Carlo testing was performed by generating 500 Neural Networks (for each Monte Carlo test), each of which was trained on the 99 training stocks and then forecast-tested on all of the 99 forecast test stocks. Each Neural Network would output a predicted price point for each of the 99 forecast test stocks.

When performing forecast testing, a threshold can be set in the software such that only stocks, for which the Neural Network predicts a certain percentage ROI, will be purchased. For example, if the threshold is set at 50%, then only stocks that the Neural Network predicts will have an ROI of 50% or higher will be purchased.

For this set of Monte Carlo test runs, the threshold was set to 50%. The average performance of the Neural Networks for each of the Monte Carlo runs (500 Neural networks generated and each made predictions for each of the 99 forecast test stocks) are shown below:

1. ??% @ a threshold of 50%
2. ??% @ a threshold of 50%
3. ??% @ a threshold of 50%
4. ??% @ a threshold of 50%
5. ??% @ a threshold of 50%

Performance Results – Super Nets

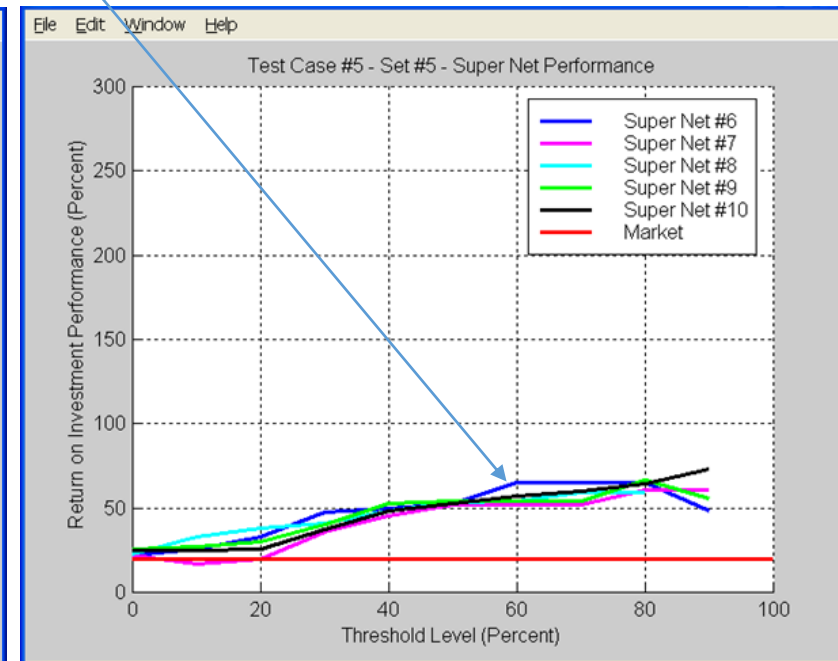

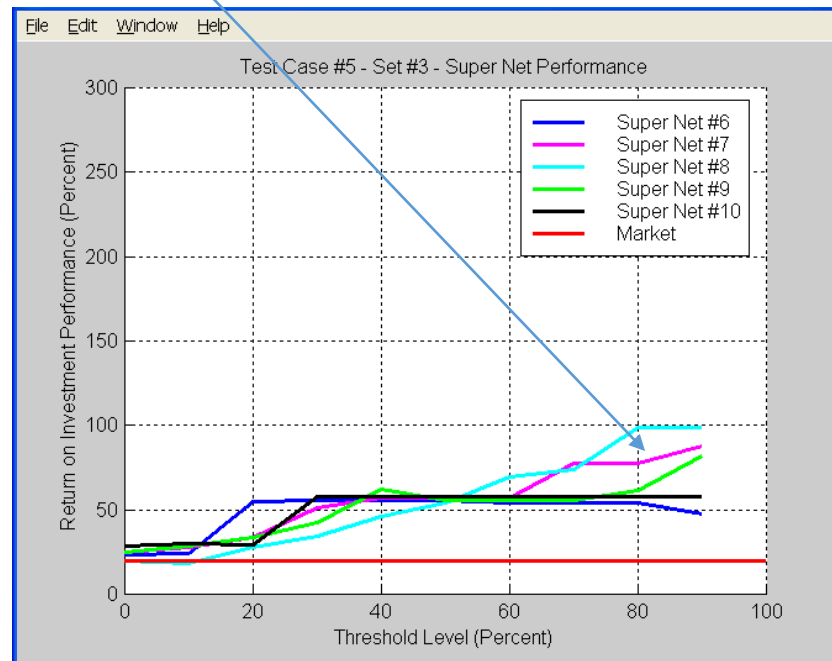

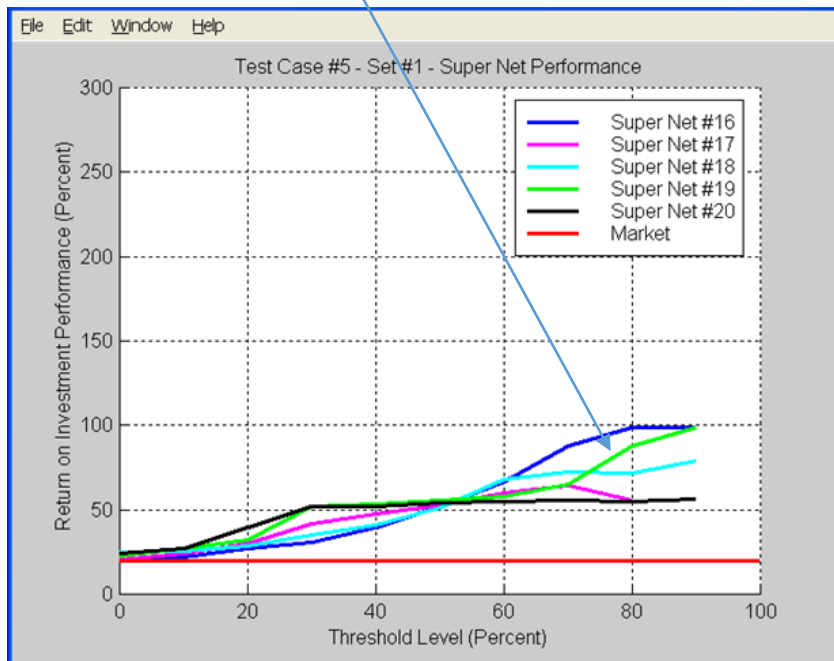

When performing forecast testing, a threshold can be set in the software such that only stocks, for which the Neural Network predicts a certain percentage ROI, will be purchased. For example, if the threshold is set at 50%, then only stocks for which the Neural Network predicts will have an ROI of 50% or higher will be purchased.

Several sets of high-achieving Neural Networks, called “Super Nets”, were generated to demonstrate their superior performance in picking stocks at the various threshold levels. The rest of the document discusses the performances for three Super Nets.

Performance Results – Super Nets

The plots on this page show Super Net ROI performance for threshold levels varying from 0% to 100%. The market ROI (aggregate return of all forecast-tested companies) of **19.7%** is shown in red for comparison purposes.

Super Net 19 (Set 1, below left), Super Net 7 (Set 3, below middle), and Super Net 6 (Set 5, below right) were selected to demonstrate performance on subsequent pages.

Performance Results – Super Nets

A comparison of the three Super Net stock picks, at the 50% threshold level, is shown below. Notice that there is overlap between the three Super Nets and that one of the Super Nets also picked two more winners as well. These Super Nets can be combined as a “Wolf Pack” to hunt together for stocks that are going to rise significantly in the next year.

Threshold = 50% for all Super Nets

Super Net #19 Stock Picks		ROI	Super Net #7 Stock Picks		ROI	Super Net #6 Stock Picks		ROI
ANIK	44.1%		ANIK	44.1%		REV	39.3%	
CAMP	77.4%		CAMP	77.4%		CAMP	77.4%	
RENT	45.0%		RENT	45.0%		RENT	45.0%	
CRUS	98.6%		CRUS	98.6%		CRUS	98.6%	
CELG	19.4%		CELG	19.4%		CELG	19.4%	
SCI	49.1%		HAL	55.8%		BDC	24.6%	
						GGG	63.3%	
TOTAL ROI		55.6%	TOTAL ROI		56.7%	TOTAL ROI		52.5%

- Stock picks that were common to two or more Super Nets and were winners
- Stock picks that were not "in common" but were still winners
- Stock picks that were not "in common" and were losers (ROI less than or equal to the market)
- Stock picks that were common to two or more Super Nets and were losers (ROI less than or equal to the market)

Super Net #19 Performance

The performance of Super Net #19 (Set 1) is demonstrated on the following page for threshold levels 70%, 50%, and 30%. Note that the advantage of using the lower threshold levels is that an investor can maintain a larger diversified portfolio of stocks while still achieving superior ROIs.

On the next page, performance at the 70% threshold level is shown on the top left section. The performance at the 50% threshold level is shown in the middle. The performance at the 30% threshold level is shown on the lower right section.

A green bar represents a winning stock pick that was added to the portfolio as the threshold was dropped. A red bar represents a losing stock pick that was added to the portfolio. Note that “losing stock pick” refers to any stock that performs at the same level of the market ROI (19.7% in this case) or below.

Super Net #19 Performance

Neural Network Rule Set Threshold = 70.0 percent

Company	Initial Investment (\$)	Purchase Price (\$)	Sell Price (\$)	Sell Value (\$)	ROI (percent)
CAMP	100.0	3.1	5.5	177.4	77.4
CRUS	100.0	14.7	29.3	198.6	98.6
CELG	100.0	30.7	36.6	119.4	19.4

The threshold is lowered to 50% and the Super Net picks 3 more companies – all three are big winners.

The threshold is lowered to 30% and the Super Net picks 4 more companies – three are big winners, and one is a minor winner.

Initial NNet Investment = \$300.0

Final NNet Portfolio Value = \$495.5

Total Return on NNet Investment = 65.2 percent

Neural Network Rule Set Threshold = 50.0 percent

CELG	100.0	30.7	36.6	119.4	19.4
ACET	100.0	5.4	7.6	140.3	40.3

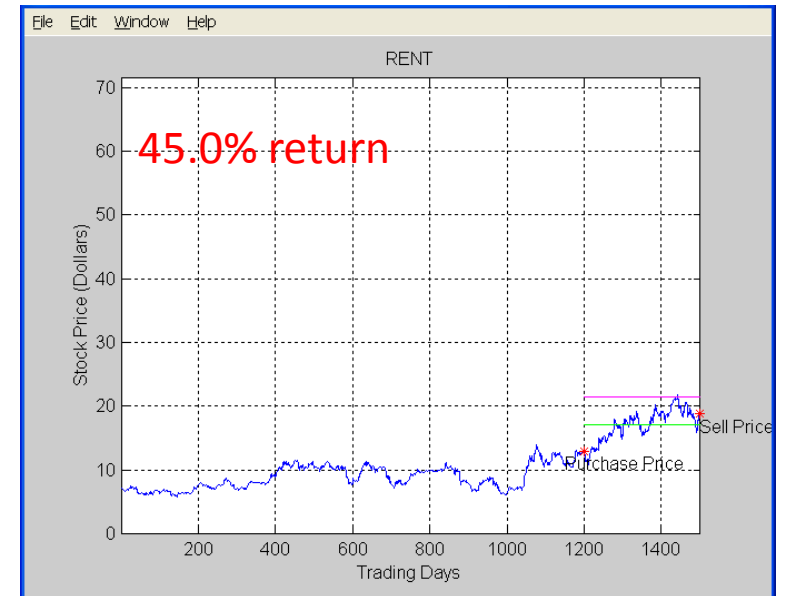

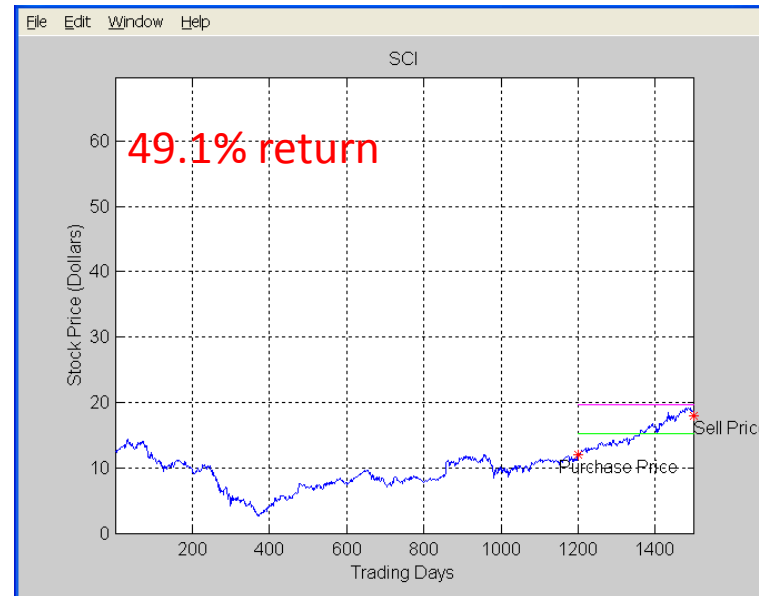

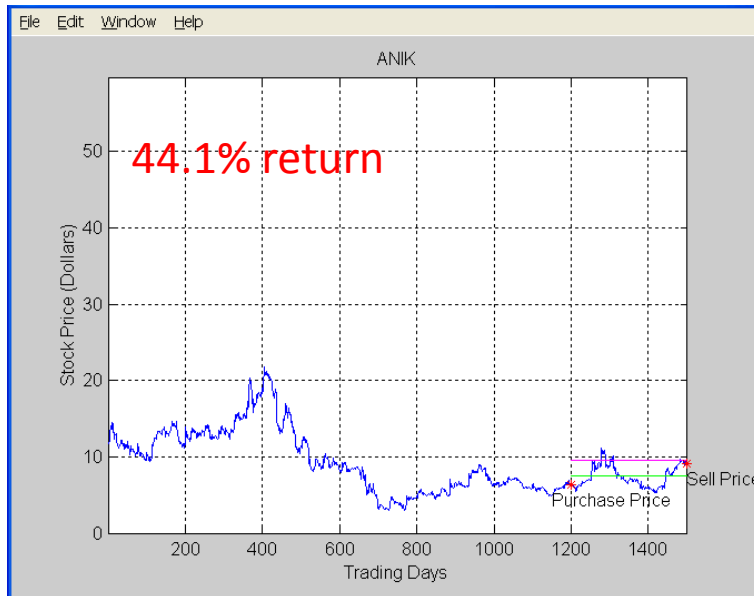

Initial NNet Investment = \$1000.0

Final NNet Portfolio Value = \$1518.5

Total Return on NNet Investment = 51.9 percent

Super Net #19 Performance

The following plots are of the three companies that were added to the mix for the 50% threshold level.

Super Net #7 Performance

The performance of Super Net #7 (Set 3) is demonstrated on the following page for threshold levels 70%, 50%, and 30%. Note that the advantage of using the lower threshold levels is that an investor can maintain a larger diversified portfolio of stocks while still achieving superior ROIs.

On the next page, performance at the 70% threshold level is shown in the top left section. The performance at the 50% threshold level is shown in the middle. The performance at the 30% threshold level is shown in the lower right section.

A green bar represents a winning stock pick that was added to the portfolio as the threshold was dropped. A red bar represents a losing stock pick that was added to the portfolio. Note that “losing stock pick” refers to any stock that performs at the same level of the market (19.7% in this case) or below.

Super Net #7 Performance

Neural Network Rule Set Threshold = 70.0 percent

Company	Initial Investment (\$)	Purchase Price (\$)	Sell Price (\$)	Sell Value (\$)	ROI (percent)
CAMP	100.0	3.1	5.5	177.4	77.4
HAL	100.0	31.5	49.1	155.8	55.8
CRUS	100.0	14.7	29.3	198.6	98.6

Initial NNet Investment = \$300.0

Final NNet Portfolio Value = \$531.9

Total Return on NNet Investment = 77.3 percent

The threshold is lowered to 50% and the Super Net picks 3 more companies – two are big winners and one is a minor loser.

The threshold is lowered to 30% and the Super Net picks 3 more companies – two are big winners, and one is a minor winner.

Neural Network Rule Set Threshold = 50.0 percent

Company	Initial Investment (\$)	Purchase Price (\$)	Sell Price (\$)	Sell Value (\$)	ROI (percent)

Final NNet Portfolio Value = \$1361.8

Total Return on NNet Investment = 51.3 percent

Super Net #7 Performance

The following plots are of the three companies that were added to the mix for the 50% threshold level.

Super Net #6 Performance

The performance of Super Net #6 (Set 5) is demonstrated on the following page for threshold levels 70%, 50%, and 30%. Note that the advantage of using the lower threshold levels is that an investor can maintain a larger diversified portfolio of stocks while still achieving superior ROIs.

On the next page, performance at the 70% threshold level is shown on the top left section. The performance at the 50% threshold level is shown in the middle. The performance at the 30% threshold level is shown on the lower right section.

A green bar represents a winning stock pick that was added to the portfolio as the threshold was dropped. A red bar represents a losing stock pick that was added to the portfolio. Note that “losing stock pick” refers to any stock that performs at the same level of the market (19.7% in this case) or below.

Super Net #6 Performance

Neural Network Rule Set Threshold = 70.0 percent

Company	Initial Investment (\$)	Purchase Price (\$)	Sell Price (\$)	Sell Value (\$)	ROI (percent)
CAMP	100.0	3.1	5.5	177.4	77.4
CRUS	100.0	14.7	29.3	198.6	98.6
CELG	100.0	30.7	36.6	119.4	19.4

The threshold is lowered to 50% and the Super Net picks 4 more companies – three are big winners, one is a minor winner.

Initial NNet Investment = \$300.0

Final NNet Portfolio Value = \$495.5

Total Return on NNet Investment = 65.2 percent

Neural Network Rule Set Threshold = 50.0 percent
